

Photosynthesis

KIDS
DISCOVER

When you get hungry, you might decide to raid the cookie jar or ask your mom to make you a sandwich. You do this because humans and animals get energy from the foods they eat.

Plants use light energy from the sun to produce the food they need to survive. This process is called photosynthesis.

INGREDIENTS

Light energy
Rays from the sun

Water
Gathered by plant's roots in the soil

Carbon dioxide
From the air

Chlorophyll
Present in cells of green plants

1 SUNLIGHT

Light shining down from the sun is absorbed by the plant's cells. These tiny cells are what make up the plant and its leaves.

Sunlight

Typical plant cell

Chloroplasts
Contain the chemical chlorophyll

2 CHLOROPHYLL

Inside some of these cells is a special ingredient called chlorophyll. This is the compound that traps the sun's light to start the process of photosynthesis.

3 WATER

Water and carbon dioxide are two of the main ingredients needed for photosynthesis. These two substances are made of many smaller parts called molecules.

Water molecules

Hydrogen atoms

Oxygen atom

Water

Photosynthesis strips away the hydrogen atom leaving only oxygen.

OXYGEN!

Oxygen

4 END RESULT

The oxygen which is left from the transformation is released back into the air. The sugar created by photosynthesis is sent to the rest of the plant for food.

Carbon dioxide molecules

Oxygen atoms
